

Homepage Speed Update: Third-Party Scripts

Homepage Speed Update: Third-Party Scripts

Site: filmartgallery.com

Summary

Crazy Egg, Microsoft Clarity, ClickCease, and Facebook Pixel are already running through Google Tag Manager — they’re not scattered, uncontrolled scripts. The problem: all of them fire the instant the page starts loading, competing with your homepage content for bandwidth. Fixing this is a settings change, not a code change.

Findings & Fixes

#	Finding	Fix	Who	Effort
1	Crazy Egg, Clarity, Facebook Pixel (104KB), + Google/Bing ad tags all fire at once, on page load	Delay these in Google Tag Manager until scroll/click/tap (or ~4s)	GTM account holder	~15 min
2	ClickCease also fires at once	Keep it fast (fraud protection needs speed) — no change needed	—	—

#	Finding	Fix	Who	Effort
3	3 unidentified tracking pixels found outside GTM	Check Shopify Admin → Customer Events for a duplicate Facebook pixel	Shopify Admin	~5 min
4	Cookie-consent script (Termly) is the single largest script on the page — bigger than the Facebook Pixel	Ask Termly if it can load without breaking consent enforcement, before we touch it	Termly support	Pending their reply
5	Country-restriction tool intentionally delays page render	Confirm with vendor if a faster mode exists	App vendor	Pending their reply

Bottom line

No images, design, or tracking tools are removed. This is purely about *timing* — stopping background scripts from competing with your content on first load. Item 1 is the biggest win and can be done today with no development work.
