

EXPERIMENT E.V. · APPLICATION PORTAL INVESTIGATION

Investigation Report

Missing Experiment Application

Investigation date: 21 August 2026

Reported applicant: Jonathan Nelio Eilert**Email:** nelio.eilert@gmail.com**Application:** Bewerbung Parlamentarisches Patenschafts-Programm 2027/2028**Reported submission / confirmation:** 11 August 2026, approximately 17:48

Key finding: the WordPress audit log records the deletion of the exact applicant account by the `Effecticore_Maintenance` administrator account. This does not, by itself, prove that the underlying application was deleted.

1. Executive Summary

The reported application cannot currently be found in the backend/application portal and the corresponding applicant account is also absent. The audit-log investigation establishes that the applicant account existed and was subsequently deleted.

Confirmed deletion event: audit occurrence 220294 records a **deleted user** event for Jonathan Eilert / nelio.eilert@gmail.com, performed under Effecticore_Maintenance.

The account was recorded as username jonathaneilert, first name Jonathan, last name Eilert, email nelio.eilert@gmail.com, role subscriber. The account deletion is strongly evidenced; the deletion of the application is **not yet proven**.

The application may still be in Gravity Forms entries or drafts, a custom application table, an orphaned record, or an export/backup. It should not be considered permanently lost until these sources are checked.

2. Client Report

The client reports that Jonathan Nelio Eilert submitted *Bewerbung Parlamentarisches Patenschafts-Programm 2027/2028* and received an automatic confirmation email on 11 August 2026 at approximately 17:48. The Experiment team could not locate the application or the account in the backend.

Field	Value
Name	Jonathan Nelio Eilert
Email	nelio.eilert@gmail.com
Username	jonathaneilert
Reported submission	11 August 2026, approximately 17:48

3. Database Environment and Relevant Tables

The default wp_ prefix did not apply. The WordPress installation uses the custom prefix wp_fmrichinnl_, confirmed by querying the post types in wp_fmrichinnl_posts.

Area	Tables identified	Why it matters
WordPress users	wp_fmrihinnl_users wp_fmrihinnl_usermeta	Account and surviving metadata
Gravity Forms	wp_fmrihinnl_gf_entry, gf_entry_meta, gf_draft_submissions, gf_form, gf_form_meta, gf_form_revisions, gf_form_view	Form submissions may be independent of the user account
Custom application data	saw202728classic, SAW2627classic, saw2627choice	Names indicate potentially relevant application-cycle workflows
Audit logs	wp_fmrihinnl_wsal_occurrences wp_fmrihinnl_wsal_metadata	Administrative activity and deletion evidence

4. Audit Log Investigation

The maintenance account was queried with:

```
SELECT id, created_on, client_ip, user_agent, event_type,
       object, username, user_id
FROM wp_fmrihinnl_wsal_occurrences
WHERE username = 'Effecticore_Maintenance'
      AND client_ip = '187.14.255.7'
ORDER BY created_on;
```

ID	Event	Object	Interpretation
220278	login	user	Maintenance session started
220286	updated	system	System change
220287–220291	modified	post	Multiple content changes
220294	deleted	user	Applicant account deletion
220296–220300	modified	post	Additional content changes

5. Critical Finding — Applicant Account Deletion

The metadata for occurrence 220294 was queried as follows:

```
SELECT occurrence_id, name, LEFT(value, 5000) AS value
FROM wp_fmrihinnl_wsal_metadata
WHERE occurrence_id = 220294
ORDER BY id;
```

TargetUserID: 40372

TargetUserData: username jonathaneilert; first name Jonathan; last name Eilert; email nelio.eilert@gmail.com; role subscriber.

This directly matches the client-reported applicant. The administrator who performed the deletion is a different user: Effecticore_Maintenance, user ID 34066. ID 34066 is the administrator; ID 40372 is the deleted applicant.

6. Maintenance Session and Related Changes

The logged-in maintenance account used IP 187.14.255.7 with a macOS Chrome user agent. The login metadata records <https://web-maintenance.effecticore.de/> as the login page URL.

Post changes recorded before deletion include *New Modern Hero Secion* (23941), *202508_Preisübersicht_Button* (23765), *202507_Experience Finder mit hellblauen Karten* (23328), *Zertifizierte Qualität* (23281), and *202507_Kontakt_Foto unten zum Scrollen_ohne Buttons* (23259). The metadata reviewed indicates content changes rather than a direct modification of this application; they should nevertheless be correlated with the maintenance work.

7. Was the Application Deleted?

Status: **NOT PROVEN** The audit log proves deletion of the WordPress user account, not the application record.

User accounts, application records, form entries, application statuses, and uploads can reside in separate structures. Deleting a WordPress user therefore does not establish that form or custom application data was removed.

1. Application still exists but is no longer associated with the deleted user.
2. Gravity Forms entry and/or entry metadata survives.
3. The record remains as a Gravity Forms draft.
4. The record resides in a custom application table.
5. The record was separately deleted and must be located in backups or exports.
6. The confirmation email was issued before final persistence completed.

8. Why the Confirmation Email Matters

The reported email is evidence that the processing workflow reached its notification stage around 17:48 on 11 August 2026. Its evidentiary weight depends on the implementation: the notification may be sent after database insertion, or before later user/application processing succeeds.

The next review should identify the source form and form ID, notification trigger, database persistence order, and any custom PHP processing that separately creates users and applications.

9. Priority Investigation Plan

Priority	Action	Search terms / scope
1	Search Gravity Forms entries, metadata, drafts, form definitions	nelio.eilert@gmail.com, jonathaneilert, Jonathan, Eilert; 11 August 2026
2	Inspect custom application-table schemas before querying rows	saw202728classic, SAW2627classic, saw2627choice
3	Check user and usermeta remnants	Applicant identifiers and 40372
4	Search all audit events/metadata around submission	Applicant identifiers, 40372, and relevant timestamps
5	Identify confirmation-email logging and trigger order	Form ID, notification config, custom workflow

10. Wider Impact Review

There is not enough evidence to claim that other applications were affected. A broader review is warranted because a real applicant account was deleted.

- Review recently deleted user events (`event_type = deleted`, `object = user`).
- For each deleted applicant, determine whether an application record remains.
- Compare backend-visible application counts with form and custom-table counts.
- When email logs are available, reconcile confirmation emails with application and user records.

11. Recommended Recovery Procedure

Safety requirement: do not restore or recreate the user before locating the original application record. Do not run DELETE, UPDATE, INSERT, or TRUNCATE during the investigation.

1. Create a database backup and preserve audit records, applicant-related rows, confirmation email, and application-table exports.
2. Locate the application using the applicant identifiers across Gravity Forms and custom tables.
3. Determine the source Gravity Forms form ID and inspect its notification/persistence logic.
4. Correlate all records with 11 August 2026 at approximately 17:48.
5. Review deletion and status history in the audit trail.
6. If no live record exists, inspect database, server, plugin, and application-specific backups/exports.
7. Only then select a recovery method that restores the original data without overwriting evidence.

12. Current Assessment and Conclusion

Finding	Assessment
Applicant account existed; identity and username matched	CONFIRMED
Applicant account was deleted by Effecticore_Maintenance	CONFIRMED BY AUDIT LOG
Application itself was deleted	NOT PROVEN
Application still exists / can be recovered	POSSIBLE
Other applications were affected	NOT ESTABLISHED
Root cause fully established	NOT YET

The available evidence confirms deletion of Jonathan Nelio Eilert's WordPress account, not permanent loss of the application. The most appropriate next action is to locate and correlate the original record across Gravity Forms, custom application tables, audit history, and backups before making any recovery change.

Investigation status: IN PROGRESS
