Headline finding

We now have a likely explanation for the 10–20 second speed spike: your mobile test shows the page frozen (nothing appears on screen at all) for **9.6 seconds**, then finishes loading 11 seconds after that. That pattern points to one specific culprit — your country-restriction tool, which is currently set up to hold the entire page from appearing until it finishes checking the visitor’s location. Under certain test conditions, that check appears to take several seconds instead of being instant.

This is the #1 priority — likely bigger than everything else combined.

Findings & Fixes

#	Finding	Fix	Who	Effort
0	Country-restriction tool holds the whole page from appearing while it checks the visitor’s location — likely the main cause of the reported slowdown	Test with it briefly disabled to confirm, then ask the vendor for a non-blocking check method	App vendor	~10 min to confirm
1	Crazy Egg, Clarity,	Delay these in Google Tag	GTM account holder	~15 min

#	Finding	Fix	Who	Effort
	Facebook Pixel (104KB), + Google/Bing ad tags all fire at once, on page load	Manager until scroll/click/tap (or ~4s)		
2	ClickCease also fires at once	Keep it fast (fraud protection needs speed) — no change needed	—	—
3	3 unidentified tracking pixels found outside GTM	Check Shopify Admin → Customer Events for a duplicate Facebook pixel	Shopify Admin	~5 min
4	Cookie-consent script (Termly) is the single largest script on the page — bigger than the Facebook Pixel	Ask Termly if it can load without breaking consent enforcement, before we touch it	Termly support	Pending their reply

Bottom line

No images, design, or tracking tools are removed. This is purely about *timing* — stopping one blocking check and background scripts from competing with your content on first load. Item 0 is the fastest way to confirm the biggest lever; item 1 is the biggest win that needs no development work at all.
